

SaQshi

A digital platform for facility quality assessment, continuous improvement and programme monitoring

What SaQshi brings together

Assessment, CQI action planning, performance monitoring, certification and reporting in one connected workflow.

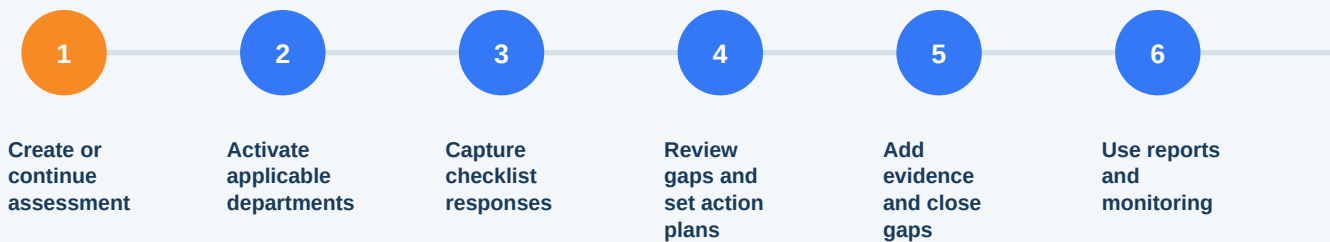

Based on SaQshi Help Documentation and GitBook project documentation

Prepared for client discussion | Public health facilities

Assessment to improvement action

The platform maintains one facility-level record across assessment, CQI, performance, certification and reporting.

1

Assessment workflow

Framework and department setup, assessor information and checkpoint scoring keep the assessment organised.

2

CQI follow-through

Non-compliance and partial-compliance checkpoints become action plans with owner, date, evidence and closure.

3

Monitoring and reports

Role-scoped dashboards, risk analysis, progress reports, KPI/outcome trends and certification tracking support follow-up.

Scoring creates a practical next step

In the NQAS profile, scores are 0 for non-compliance, 1 for partial compliance and 2 for full compliance. Scores of 0 or 1 feed the gap analysis and CQI action-plan workflow.

Role-based programme oversight

SaQshi separates facility work from supervisory monitoring while retaining an accountable audit trail.

Facility teams

Create assessments, complete checklists, manage actions, attach evidence and enter monthly KPI or outcome data.

Assessor and monitoring roles

Assessors work on mapped facilities; block, district, division and state users see only their assigned scope.

Governance boundary

SaQshi supports facility-level quality information. It does not require patient-level clinical records or identifiers.

Configurable foundation

Frameworks, masters, performance indicators, certification rules and geography settings use configuration files.

A practical first pilot

- Agree the facility cohort, quality framework and reporting needs.
- Configure roles, masters, workflow rules and dashboards.
- Pilot with facility and monitoring users, then refine before scale.
